

Hazardous materials

Soil and groundwater contamination

- We found minor isolated soil and groundwater contamination at both sites.

Dredged sediments

- Constructing the launch channel would require dredging in Grays Harbor. We would handle dredged sediments differently for each site:
 - Anderson & Middleton: All materials could likely be disposed in open water areas.
 - Aberdeen Log Yard: A portion of materials may need to be disposed at an upland site.
 - Additional analysis is ongoing and we anticipate that more material from the Aberdeen Log Yard site may be suitable for open water disposal.
