APPENDIX 8.3-B2

3-SIDED PRECAST BURIED STRUCTURES
DESIGN CRITERIA
I. GENERAL

The criteria is for the highway and hydraulic buried structures of precast or cast-in-place three sided, semi-arch, and arch systems.

The terminology of buried structure is used for all highway and hydraulic structures, and the culvert is used for hydraulic structures only.

The selection of type of structures is depending on span and rise requirements determined by Highway, Environmental, Hydraulic, and Geotech requirements. Bridge Office has developed the 3-sided structures with spans from 20' to 60', see Preliminary Culvert Standards 8.3.3-A3 to 8.3.3-A4, and 8.3.3-A9.

The buried structures to be designed for the following guidelines; any special consideration shall be consulted with the Bridge Design Engineer, Geotech Engineer, and Hydraulic Engineer.

II. DESIGN SPECIFICATIONS

E. NFPA 502 Standard for Road Tunnels, Bridges, and Other Limited Access Highways.

F. ASTM C 1504 - Three-sided structures for storm water and culverts

G. ACI 318, for tunnel and special design.

III. DESIGN PROCEDURES

After the structure type has been selected. The structure design is following into two steps:

A. For Service I and Strength I Limit States - Use Gstrudl, CSI Bridge, or other programs to determine the forces.

B. For Extreme I Limit State - Use "Racking Method" per the design specification D above, to determine the forces for the Earthquake. The analysis for racking may be done either GStrudl, CSI Bridge, or other programs.
IV. GEOMETRY

Use Preliminary Culvert Standard 8.3.3-A3 for thickness of deck and wall.

Wall Thickness $T = 8''$ min. for span < 24'
$T = 10''$ min. for span > 24'

Max skew = $45^\circ$ (to centerline of structure)

V. LOADING DIAGRAMS

VI. DESIGN LOADING

A. DC and DW - Dead Load
1. Concrete structure dead load = 155 lb/cf
2. Overburden fill = 125 lb/cf (or provided by the Geotech Engineer)
3. HMA overlay = 140 lb/cf
4. Backfill along walls = 125 lb/cf (or provided by the Geotech Engineer)

B. EH, EV, ES, LS, and ES - Earth Pressure
1. EH - Horizontal Earth Pressure
   \[ p = k \cdot \gamma_s \cdot z \]
   $k = k_0$ specified in sect. 3.11.5.2 for wall that not deflect, which applies for the frame type structure.
2. EV - Vertical Earth Pressure due to overburden soil above the structure
   A. Embankment Installation
   \[ EV = W_e = F_e \cdot \gamma_S \cdot B_c \cdot H \]
   \[ F_e = 1 + 0.20 \frac{H}{B_c} \]

   B. Trench Installation
   \[ EV = W_e = F_t \cdot \gamma_S \cdot B_c \cdot H \]
   \[ F_t = \frac{C_d \cdot B_d^2}{H \cdot B_c} \leq F_e \]

3. ES - Earth pressure Surcharge
   The earth pressure surcharge to be provided by the Geotech engineer.

4. LS - Live Load Surcharge
   2' live load surcharge to be used.

C. LL - Live Load on top of Culvert
   Live load consists of standard AASHTO design truck load or tandem, with 1.2 single lane multiple presence factor.

   Three conditions of liveload application on top of buried structure:
   . 2' of fill or less.
   . 2' to 8' of fill.
   . > 8' of fill

   Two cases of live load distribution on top of the buried structures to be considered:
   . The live load \textit{parallel} to the culvert span, and
   . The live load \textit{perpendicular} to the culvert span.

   In most cases of the buried structures, live load \textit{parallel} to structure will control for the traffic on top of the structure.
Condition 1 - 2’ of fill or less
- Live load distributed to top slab per sections 3.6.1.2.6 and 4.6.2.10

The distribution of the wheel load in both directions are analyzed below:

\[ E_{WIDTH} = 96 + 1.44S \]
\[ E_{SPAN} = L_T + LLDF (H) \]

\( S = \) span length
\( H = \) Depth of ground cover on top of culvert

**Case 1 - Traffic travels parallel to span of buried structure**

**Live load distribution parallel**

**Live load distribution transverse**

Case 2 - Traffic travels perpendicular to span of buried structure
(not considered at this time)

Condition 2 - 2’ to 8’ of fill - Live load distributed to top slab per section 3.6.1.2.6a

Case 1 - Traffic travels parallel to span of buried structure
(see the loading pictures above)

**Live load distribution parallel to the buried structure**

\[ H_{int-p} = \frac{S_a - \frac{L_T}{12}}{LLDF} \]

Where \( H < \) Hint-p

\[ l_w = \frac{L_T}{12} + LLDF(H) \]

Where \( H > \) Hint-p

\[ l_w = \frac{L_T}{12} + S_a + LLDF(H) \]

**Live load distribution transverse to the buried structure**

\[ H_{int} = \frac{S_w - \frac{w_t}{12} - 0.06 \times \frac{D_t}{12}}{LLDF} \]

Where \( H < \) Hint

\[ w_w = \frac{w_t}{12} + LLDF \times H + 0.06 \times \frac{D_t}{12} \]

Where \( H > \) Hint

\[ w_w = \frac{w_t}{12} + s_w + LLDF \times H + 0.06 \times \frac{D_t}{12} \]

Case 2 - Traffic travels perpendicular to span of buried structure
Condition 3 Fill > 8' and > span length
Ignore the live load effects per 3.6.1.2.6a
For fill < 8', the live load effect shall be considered.

D. Live Load Impact
The dynamic load allowance for buried structures:

\[ IM = 33 \left( 1.0 - 0.125 \cdot D_E \right) = \text{or} > \text{than} 0 \]

<table>
<thead>
<tr>
<th>( D_E ) (ft)</th>

<tr>
<td>8</td>
<td>0.00</td>
</tr>
</tbody>
</table>

\( D_E = \text{depth of cover} \)

Per inspection, the Impact Factor can be ignored for \( D_E > 8' \)

E. Truck and Train Impact
For the cases where the buried structures to be used for highway and railroad structure only.

F. Thermal, Creep, and Shrinkage
1. Thermal in transverse direction for joint between segments
   The thermal loading may be considered for joint gap between segments.

G. Post-Tensioning
Post-tensioning may be used to connection the segments together in longitudinal section due to settlement and other issues.

H. WA - Hydrostatic, Stream, and Buoyancy (for culvert structure only)

I. Seismic Load
The seismic design for the underground structures shall be analyzed according to the FHWA-NHI-10-034 "Technical Manual for Design and Construction of Roadway Tunnels - Civil Elements" on racking and vertical ground acceleration.

1. Racking Analysis

2. Vertical Ground Acceleration Effects
Design notes:

Per design experience - no racking analysis is needed for culvert span of 25' or less, height 15' or less, and fill cover less than 10'. Due to the deflection and forces of the racking analysis is very small.

VII. LOAD COMBINATIONS

A. Limit States
Design per AASHTO Table 3.4.1-1

</tbody>
</table>

B. Resistance Factors

Strength Limit
Flexural, $\phi = 1.00$ for Precast and 0.95 for Cast-in-Place
Shear, $\phi = 0.90$
Bearing, $\phi = 0.70$ bearing on concrete

Extreme Limit
Flexural, $\phi = 1.00$
Shear, $\phi = 1.00$
Bearing, $\phi = 1.00$

C. Non-Redundancy
$\eta_R = 1.05$ per section 1.3.4

VIII. STRUCTURAL MATERIALS

A. Concrete
Class 5000, 6000, and 7000 for precast and 4000 for CIP elements.
Class 7000 SCC per manufacturer's recommendation.

B. Reinforcement
AASHTO M31 (ASTM A615) for all. Welded Wire fabric (ASTM A 1064) can be used in place of ASTM A615.

IX. SPECIAL STRUCTURAL DESIGN AND DETAILS
A. Joint Types

1. Longitudinal Connection - between segments
   AASHTO Section 12.14.5.4 requires means of shear transfer with flat top and less than 2’ fill.

Case A - for traffic inside the buried structure
   The precast segments need closure pour type of connection to prevent any water leaking down from top as shown below.

Case B - for general stream culvert
   Either welded tie, tongue and groove, or shear key type of connection can be used, see below. (Other types of connection may be used per approval by the Engineer).
The butyl joint sealant shall be conformed to ASTM C 990.

2. Connection between precast culvert and CIP footing
B. Waterproofing System
For buried structure that carries traffic inside the structure, the waterproofing to be used on top of the buried structures.

For the buried structure carries stream inside the structure, the external joint wrap over the joints between segments to be used. The external joint wrap shall be conformed to ASTM C 877.

C. Scour Protection
   For buried structure that carries traffic inside the structure, the fire protection may required per NFPA 502.

D. Fire Protection System
   For buried structure that carries traffic inside the structure, the fire protection may required per NFPA 502.

X. MISCELLANEOUS DETAILS
   A. Cable Rail on Headwalls and Wingwalls
   Fall protection shall be provided in accordance with WAC 296-155-24609 for exposed wall height of 4' or more.
