

1 (January 3, 2011)

2 If confirmation testing shows the initial scale has been underweighing, the on-site
3 representative of the Contractor shall be notified. The Contractor shall not be
4 compensated for any loss from underweighing.

5

6 If the initial scale has been overweighing, the on-site representative of the Contractor
7 shall be notified and the Contracting Agency will calculate a price adjustment as follows:

8

9 The combined weight of all materials weighed after the last test showing accurate
10 results through the load preceding the next confirmation test shall be calculated. This
11 combined weight will then be reduced by the percentage of weighing error that
12 exceeds one-half of one percent. If subsequent confirmation tests continue to show
13 overweighing, then the highest correction factor calculated from all tests shall be
14 applied to all loads weighed after the last successful test and before a new
15 confirmation test that shows accurate results.

16

17 If the specifications and plans require weight measurement for minor construction items,
18 the Contractor may request permission to convert volume to weight. If the Engineer
19 approves, an agreed factor may be used to make this conversion.
