APPENDIX A

FYFE COMPANY RETROFIT DESIGN CALCULATIONS

WSU COLUMN RETROFIT

Equations utilized in following spreadsheet:

Effective column height based on provided moment values and corresponding diagrams.
Plastic hinge length=(0.8)(Effective column height)+0.15(60ksi)(bar diameter).
Ideal yeild curvature is taken from the moment-curvature analysis.
Yield displacement=(ideal yeild curvature)*(effective column height)^2/3.
Neutral axis depth is taken from the moment-curvature analysis.
Mu is taken from the moment-curvature analysis.
Required ultimate curvature =(curvature ductility)(ideal yeild curvature).
Required ultimate compressive strain=(required ultimate curvature)(neutral axis depth)
Required volumetric ratio=0.8(required ultimate compressive strain-0.004)(1.5f'c)/(fu*eu)
fu=ultimate composite stress=60ksi
eu=ultimate composite strain=0.02
Required jacket thickness=0.5(required volumetric ratio)((depth*width)/(depth+width))
Required number of layers for required curvature=required thickness/0.051
Max. Shear is from a 50% overstrength value.

RE: WSU / WSDOT Split Column Tests

David,

In a recent conversation with one of your researchers, Paul Rogness, it came to my attention that the calculations and design drawings for the transverse loading specimen of the above referenced tests did not properly include the splice confinement. The methodology that we followed, that developed by the University of California at San Diego, explicitly calculates the confinement for reinforcement lap splice zones. However, this methodology also recognizes that confinement of rectangular splice zones with rectangular jackets is not entirely possible. Since your tests were conducted on such a configuration, and since this effect was one of the parameters that you were investigating, I calculated the numbers of Replark 30 wraps that would have been recommended for the tests of the splice zone. The attached calculations indicate that 11 or so wraps would have been required. We understand that the performance of the specimens with the 6 wraps that were provided was fairly good. We would expect that if 11 wraps had been used, the performance may have been somewhat better. Therefore, the results probably form a lower bound to the performance expected if the calculated number of wraps are used. I hope that this additional information can be of help to you. If you have any questions, please give me a call.

Regards,

Lee

BERGER/ABAM ENGINEERING INC

Project: Sumitomo Wrap — Sheet 1 of 6
W30 Split Column Tests — Job Number F95100
Subject: Splice-Zone Confinement — Designer LM
Date 5/13/99

Jacket Thickness (treat rectangular as equiv. circular col.)

for equiv. circular column, $t_j = 500\,\frac{D(f_l - f_h)}{E_j}$

$D \sim 16.33''$ equiv. dia. from prev. calc. f_l as yet 300 psi* f_h assume = 0 $E_j = 33426$ ksi

$t_j \sim 500\,\frac{(16.33'')(300\ \text{psi})}{33426\ (1000)\ \text{ksi}\ \text{psi/ksi}} = 0.0733''$

Ref: ACTT-95/06 Earthquake Retrofit of Bridge Columns w/ Continuous Carbon Fiber Jackets §4

$\#\text{wraps} = \frac{0.0733}{0.0066} \approx 11$ wraps reqd — Replace 10 wraps reqd

* Calc. f_l: $f_l = \frac{A_s f_y}{\left[\frac{p}{2n} + 2(d_b + cc)\right] L_s}$

p = inside crack perimeter
d_b = bar dia.
n = # of bars
cc = clr cover
L_s = splice length

approx. $p \sim 16.33 - 0.67(2)\pi = 15''$

$n = 10$ bars
$d_b = 0.375''$
$cc = 0.67''$
$L_s = 7.5''$ $(20 d_b)$

$A_s = 0.11(10) = 1.1\ \text{in}^2$
$f_y = 44$ ksi

$f_l = \frac{44(1.1)}{\left[\frac{15}{2(10)} + 2(0.375 + 0.67)\right] 7.5} \approx 0.264$ ksi use 300 psi Ok

ACTT-95/06 Does not recommend using rectangular jackets on rectangular columns to confine splice zones. If some debonding is permissible in the splice zone, then rect. jackets may be effective. Also typically the calc. jacket thickness would be doubled, producing 0.14 in. or 22 wraps.

BERGER/ABAM ENGINEERS INC

Project: Sumitomo Wrap — WSU Split Column Tests
Subject: Splice Zone Confinement
Sheet: 2 of 6
Job Number: PG6105
Designer: LH
Date: 5/13/99

Alternate method of determining jacket thickness

Ref: Seismic Design & Retrofit of Bridges, Priestley, Seible, Calvi 1996 §8.2.2(b)(iii)

$$\rho_{sj} = 2\,\frac{(A_b f_s / \mu p l_s - f_l)}{0.0015\, E_j}$$

ACTT based on 0.001 ε so this is less conservative

$$f_l = \frac{A_b f_s}{\mu p l_s} = \frac{1.21 A_b f_{yl}}{p l_s}$$

$$f_l = \frac{1.21(1.1)40}{15(7.5)} = 0.47 \text{ ksi}$$

$$\rho_{sj} = \frac{2(0.47)}{0.0015\,(33425)} = 0.0189$$

$$\rho_s = 2 f_j \left[\frac{b+h}{bh}\right]$$

for rectangle

$$f_j = \frac{\rho_s}{2}\,\frac{bh}{[b+h]} = \frac{0.0189}{2}\,\frac{(7")13"}{(7"+13")}$$

$$f_j = 0.043 \text{ in}$$

$$\#\text{ wraps} = \frac{0.043}{0.0066} = 6.5$$

Replace 30 wraps reqd

Note: if use $f_l = 0.47$ → $\varepsilon = 0.0015$ (1st ACTT eqn)

$$f_j = \frac{540(16.33).47}{33425}\left(\frac{.001}{.0015}\right) = 0.077$$

$$\#\text{ wraps} = \frac{0.077}{0.0066} = 11.6 \text{ wraps}$$

- or about the same as before.

but ACTT method may be a better predictor since ρ_s as calc. for a rectangle is not truly applicable.

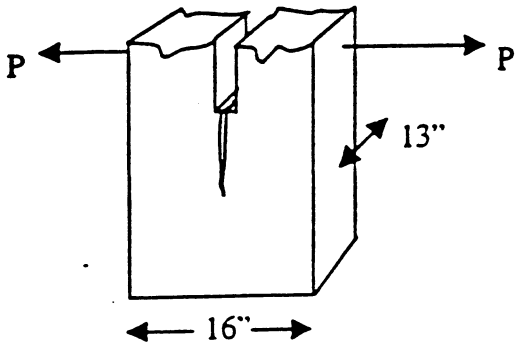
"Chopsticks" Design – Part 2



Goal: limit crack width to 1 mm in the 16" x 13" wide section to assure aggregate interlock in the concrete.

1) 1 mm x 1 in/25.4 mm = .03937" total crack width in concrete section

2) This crack width spread over the 16" wide section would be:
.03937"/16" = .00246 in/in of width = .246% strain = the strain limit in composite

3) Now, using: $\sigma_{applied} = \varepsilon E$
then: $\sigma_{applied} = (.00246)(12{,}000{,}000)$
$= 29{,}520$ lbs/in^2 would be developed in the composite at that strain level.

4) Using a material with a strength of 120,000 lb/in^2, we would need 29,520/120,000 or .246 in^2 of material to restrain the concrete.

5) If this area was spread out over 6", it would be .041" thick (.246in^2/6" = .041")
Over 12", it would be .0205" thick.

6) Therefore, as a safe design that both restrains the crack and allows for a smooth transition of load resistance, we will apply (2) layers of .0266" thick GA180 fabric to the column: (1) 12" wide section overlaid by a (1) 6"-wide section applied to the top 6". The bottom 6" would have a thickness of .0266" and the top 6" would have a thickness of .0532".

XXSYS "GROUTED" COLUMN DESIGN

Column Specifications:

Column Height,	$L := 104$	(in)
Shear Span,	$L_e := 104$	(in)
Column Width,	$B := 16$	(in)
Column Depth,	$D := 13$	(in)
Concrete Cover,	$cc := 0.67$	(in)
Concrete Compressive Strength,	$f_c := 5000$	(psi)
Longitudinal Reinforcement 20 #3	$f_{yl} := 40$	(ksi)
Number of Bars	$n := 16$	
Bar Diameter	$d_b := 0.375$	(in)
Bar Area	$A_b := 0.11$	(in^2)
Steel Modulus	$E_s := 29000$	(ksi)
Transverse Reinforcement 0.12 @ 4 in.	$f_{yt} := 40$	(ksi)
Bar Diameter	$d_s := 0.12$	(in)
Bar Area	$A_s := 0.011$	(in^2)
Spacing	$s := 4$	(in)
Lap Splice Length,	$L_s := 7.5$	(in)

Section Properties:

Axial Load,	$P := 0$	(kips)
Moment Capacity,	$M_{yi} := 547.2$	(kip in)
Yield Curvature,	$\phi_y := 0.000235$	(1/in)
Neutral Axis Depth,	$c_u := 0.9$	(in)

Jacket Material Properties:

Jacket Modulus,	$E_j := 12000$	(ksi)
Ultimate Jacket Strength,	$f_{ju} := 120$	(ksi)
Ultimate Strain,	$\varepsilon_{ju} := 0.01$	(in/in)

Required Displacement Ductility: $\mu_\Delta := 8$

Shear Strength Retrofit:

Plastic shear including overstrength =

$$V_o := 1.5 \cdot \left(\frac{M_{yi}}{L_e} \right) \qquad V_o = 7.9 \quad \text{(kips)}$$

Concrete shear contribution =

$$k := \text{if}\left(\mu_\Delta < 2, 3, \text{if}\left(\mu_\Delta < 4, 5 - \mu_\Delta, \text{if}\left(\mu_\Delta < 8, 1.5 - \frac{\mu_\Delta}{8}, \text{if}\left(\mu_\Delta \geq 8, 0.5, 0.5\right)\right)\right)\right) \qquad k = 0.5$$

$$V_{ci} := k \cdot \sqrt{f_c} \cdot 0.8 \cdot (D \cdot B) \cdot 10^{-3} \qquad V_{ci} = 5.9 \quad \text{(kips)}$$

$$V_{co} := 3 \cdot \sqrt{f_c} \cdot 0.8 \cdot (D \cdot B) \cdot 10^{-3} \qquad V_{co} = 35.3 \quad \text{(kips)}$$

Hoop reinforcement shear contribution =

$$D_c := D - 2 \cdot cc + d_b$$

$$\theta := 45$$

$$\alpha := \theta \cdot \frac{\pi}{180} \quad \text{(change to radians)}$$

nbar := 2 (# transverse bars)

$$V_s := \frac{nbar \cdot A_s \cdot f_{yt} \cdot D_c}{s} \cdot \cot(\alpha) \qquad V_s = 2.6 \quad \text{(kips)}$$

Axial load shear contribution = $V_p := P \cdot \frac{D - c_u}{2 \cdot L_e}$ $V_p = 0$ (kips)

Jacket thickness inside the plastic hinge region t_{ji} =

Strength reduction factor ϕ $\phi := 0.85$

$$t_{vi} := \frac{125}{(E_j \cdot D)} \cdot \left[\frac{V_o}{\phi} - (V_{ci} + V_s + V_p) \right] \qquad t_{vi} = 6.044 \cdot 10^{-4} \text{ (in)} \quad <<<<<<$$

Jacket thickness outside the plastic hinge region t_{jo} =

$$t_{vo} := \frac{125}{(E_j \cdot D)} \cdot \left[\frac{V_o}{\phi} - (V_{co} + V_s + V_p) \right] \qquad t_{vo} = -0.023 \quad \text{(in)} \quad <<<<<<$$

Flexural Plastic Hinge Confinement:

Equivalent column diameter D_e =

$$A := D$$

$$k := \left(\frac{A}{B}\right)^{\frac{2}{3}}$$

$$b := \sqrt{\left[\frac{A}{(2\cdot k)}\right]^2 + \left(\frac{B}{2}\right)^2}$$

$$a := k\cdot b$$

$$R_1 := \frac{b^2}{a}$$

$$R_2 := \frac{a^2}{b}$$

$$D_e := R_1 + R_2 \qquad D_e = 20.862 \quad \text{(in)}$$

Plastic hinge length = $L_p := L_e\cdot 0.08 + 0.15\cdot f_{yl}\cdot d_b$ $\qquad L_p = 10.6$ (in)

Curvature ductility demand =

$$\mu_\phi := 1 + \frac{\mu_\Delta - 1}{3\cdot\left(\frac{L_p}{L_e}\right)\cdot\left[1 - 0.5\cdot\left(\frac{L_p}{L_e}\right)\right]} \qquad \mu_\phi = 25$$

Required ultimate compression strain in the concrete =

$$\varepsilon_{cu} := \mu_\phi\cdot\phi_y\cdot c_u \qquad \varepsilon_{cu} = 0.0053$$

Jacket thickness t_{c1} and t_{c2} =

$$t_{c1} := \left[0.1\cdot\frac{D_e\cdot\left(\varepsilon_{cu} - 0.004\right)\cdot 1.5\cdot f_c}{f_{ju}\cdot\varepsilon_{ju}}\cdot 10^{-3}\right]\cdot 2 \qquad t_{c1} = 0.035 \quad \text{(in)} \quad <<<<<<$$

$$t_{c2} := \frac{t_{c1}}{2} \qquad t_{c2} = 0.017 \quad \text{(in)} \quad <<<<<<$$

Thickness to prevent bar buckling = $t_b := \frac{n\cdot D'}{E_j}$ $\qquad t_b = 0.017$ (in)

Lap Splice Clamping:

Available lateral clamping pressure =

$$f_h := 0 \qquad f_h = 0 \quad \text{(ksi)}$$

Required clamping pressure =

$$dd := \left[D - 2 \cdot \left(d_b + cc \right) \right]$$

$$bb := \left[B - 2 \cdot \left(d_b + cc \right) \right]$$

$$p := 2 \cdot (dd + bb)$$

$$f_l := \frac{A_b \cdot f_{yl}}{\left[\frac{p}{2 \cdot n} + 2 \cdot \left(d_b + cc \right) \right] \cdot L_s} \qquad f_l = 0.161 \quad \text{(ksi)}$$

Required jacket thickness =

$$t_s := \left[500 \cdot \left(\frac{D_e}{E_j} \right) \cdot \left(f_l - f_h \right) \right] \cdot 2 \qquad t_s = 0.28 \quad \text{(in)} \quad <<<<<<$$

Jacket Specifications:

Shear Strength Component =

$L_{vi} := 1.5 \cdot D$ $\quad L_{vi} = 19.5$ (in) >>>>> $t_{vi} = 6.044 \cdot 10^{-1}$ (in)

$L_{vo} := L - 2 \cdot L_{vi}$ $\quad L_{vo} = 65$ (in) >>>>> $t_{vo} = -0.023$ (in)

Confinement Component =

$L_{c1} := \text{if}\left(0.5 \cdot D \geq 0.125 \cdot L_e, 0.5 \cdot D, 0.125 \cdot L_e\right)$ $\quad L_{c1} = 13$ (in) >>>>> $t_{c1} = 0.035$ (in)

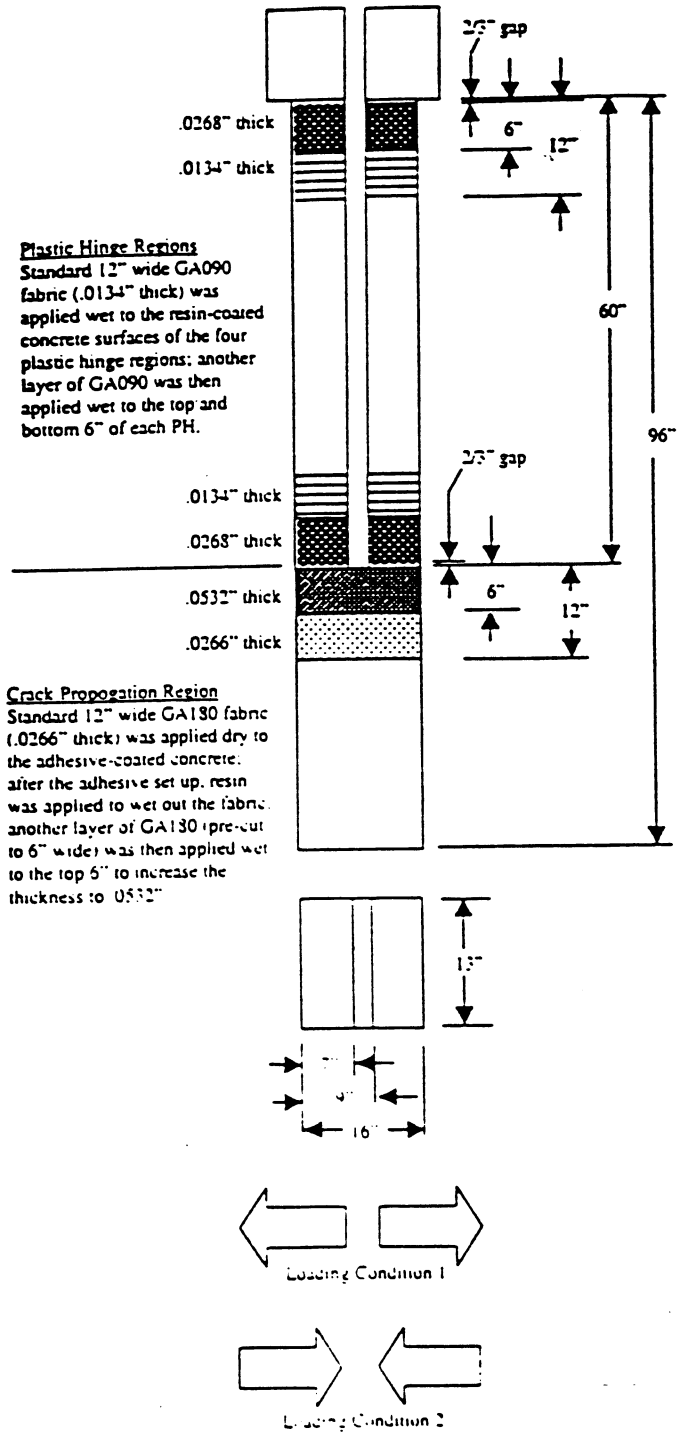
Composite Lay-up for WSU Split Column Tests

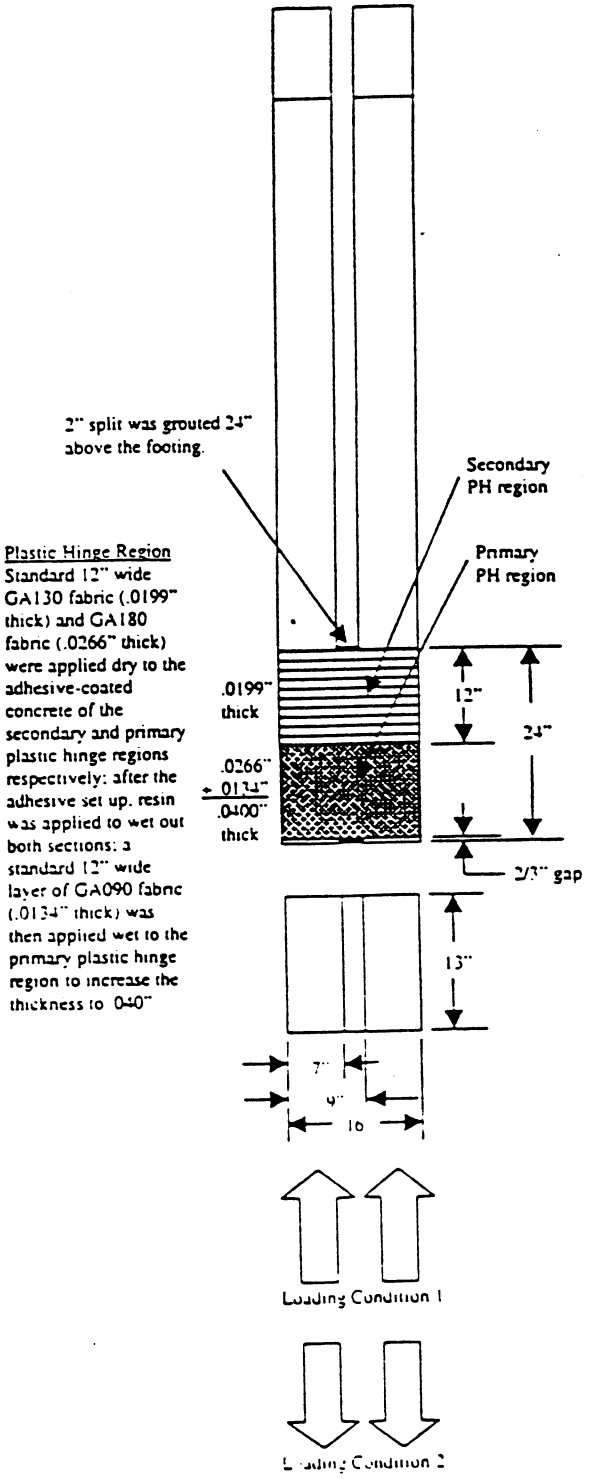
Out-of-Phase, Longitudinal Loading, Double Bending ("Chopsticks")



Plastic Hinge Regions
Standard 12" wide GA090 fabric (.0134" thick) was applied wet to the resin-coated concrete surfaces of the four plastic hinge regions; another layer of GA090 was then applied wet to the top and bottom 6" of each PH.

Crack Propogation Region
Standard 12" wide GA180 fabric (.0266" thick) was applied dry to the adhesive-coated concrete; after the adhesive set up, resin was applied to wet out the fabric; another layer of GA130 (pre-cut to 6" wide) was then applied wet to the top 6" to increase the thickness to .0532"

Transverse Loading, Single Bending ("Grouted")



Plastic Hinge Region
Standard 12" wide GA130 fabric (.0199" thick) and GA180 fabric (.0266" thick) were applied dry to the adhesive-coated concrete of the secondary and primary plastic hinge regions respectively; after the adhesive set up, resin was applied to wet out both sections; a standard 12" wide layer of GA090 fabric (.0134" thick) was then applied wet to the primary plastic hinge region to increase the thickness to .040"

Quantities of products used to construct the lay-ups

Carbon Fiber Fabric	*"Chopsticks"* Plastic Hinges (4 places)	*"Chopsticks"* Crack	*"Grouted"* Plastic Hinge
GA090 8.9 oz/yd^2 .0134" thick	(1) 47¼ x 12" (1) 47¼" x 6"	–	(1) 65" x 12" (lower 12")
GA130 13.2 oz/yd^2 .0199" thick	–	–	(1) 65" x 12" (upper 12")
GA180 17.7 oz/yd^2 .0266" thick	–	(1) 65" x 12" (1) 65" x 6"	(1) 65" x 12" (lower 12")

(all fabrics are 12K, all come 12" wide standard (6" wide sections had to be cut), thickness assumes 50% V_f)

Adhesive	*"Chopsticks"* Plastic Hinges (4 places)	*"Chopsticks"* Crack	*"Grouted"* Plastic Hinge
Bondtite R37	not used	1.210 lbs.	2.37 lbs.
Bondtite H37	not used	.403 lbs.	.79 lbs.

(3:1 mix ratio; coverage rate: .333lbs/ft^2)

Resin	*"Chopsticks"* Plastic Hinges (4 places)	*"Chopsticks"* Crack	*"Grouted"* Plastic Hinge
826	(2) 2.274 lbs.	2.178 lbs.	3.18 lbs.
3379	(2) 1.170 lbs.	1.122 lbs.	1.62 lbs.

Note: 2 kits of the size shown were made to wet out the "Chopsticks" PH regions - 1 kit was made for the two "bottom" PHs and another kit was made for the two "top" PHs. Since the "top" PHs were the last to be applied and wetted out, an additional .379 lbs. of 826 and .195 lbs. of 3379 were added to the kit in order to have some resin left over to wet out any "dry" or "drier looking" areas on either test column. As it turned out, this extra resin wasn't really needed, but was applied anyway.
